

AI-Assisted Production Workflow

Blueprint to built pages, human-in-the-loop

This workflow turns an approved blueprint into built, learner-ready pages. Automation does the repetitive lifting. A person holds authority over anything that reaches a learner. The discipline is not in the generation; it is in the gates. The model proposes, a person decides, and every decision leaves a record.

PRINCIPLE

AI multiplies labor. People own the outcome.

The role of the model and the role of the human are written down before work starts, so the line of accountability is never blurry. The model is fast and tireless and occasionally wrong with great confidence. The human is the reason a learner can trust what they read.

THE PIPELINE

Six stages, blueprint to publish

Generation is cheap and reversible. The gates are where the work is. Removing a gate to save time is the one optimization that always costs more later.

CONTROL POINTS

What the human checks at each gate

GATE	THE REVIEWER CONFIRMS
Gate 1 Voice & accuracy	Every factual claim is correct. The instructor's voice is intact. Nothing was invented to fill a gap. Examples actually demonstrate the point.
Gate 2 Two-pane QA	Alignment holds objective to assessment. Accessibility is met. Assets resolve. Severity log clean per the QA protocol.

THE AUDIT RECORD

What gets logged, every time

- Which model and version produced the draft.
- The instruction the model was given.
- What the human reviewer changed, and the reason.
- Who signed off, and when.

The record means a page can always be traced back: what was automated, what was judged, and by whom. That is what makes the speed defensible.

BOUNDARIES

What the model never decides alone

×	Whether an assessment validly measures the objective.
×	The accuracy of any claim a learner will act on.
×	Accessibility sign-off.
×	Anything learner-facing, without a human review on the record.

Abstracted sample. Client names and proprietary content withheld. Structure and method are representative of production work.
