

Course Design Blueprint

Module template with a worked example

A module-level blueprint is the contract for a unit of learning. It records every decision once, in one place, so the build stays aligned and any designer can pick it up. This sheet shows the template, then a worked example.

THE TEMPLATE

One module, fully specified

MODULE TITLE & POSITION

Where it sits in the course arc, and what it depends on.

MODULE LEARNING OBJECTIVE

A single **measurable** outcome. One verb the learner can be tested on.

LESSON SEQUENCE

The pattern that gets them there: read, model, try. Each lesson maps to the objective.

ASSESSMENT

The evidence of success, aligned to the objective and pitched at the right stakes.

ASSET LIST

Every required asset, tagged and tracked to a source.

ACCESSIBILITY & TIME

Checks performed at build, plus estimated learner time on task.

If a lesson does not trace to the module objective, it is either the wrong lesson or the wrong objective. The blueprint forces that question before anyone builds a page.

Applied Data Literacy · Module 4

Position	Fourth of seven. Assumes Modules 1 to 3 (data types, basic queries, table relationships).
Module objective	Validate a data model against a set of stated business rules, and identify where it breaks.
Estimated time	3.5 hours on task across the module.

Alignment chain

Lesson sequence

LESSON	PATTERN	LEARNER DOES
4.1	Read	Reviews the four rules a sound model must satisfy.
4.2	Model	Watches one schema get validated, rule by rule.
4.3	Try (guided)	Validates a partial schema with hints available.
4.4	Try (solo)	Audits the flawed schema. This is the assessment.

Asset list

ASSET	TYPE	STATUS / SOURCE
Flawed schema file	data	Built in house, tagged M4-A01
Validation rubric	doc	Reused from M2, revised
Walkthrough video (3 min)	video	Scripted, in production
Browser sandbox	tool	Platform-provided

Abstracted sample. Client names and proprietary content withheld. Structure and method are representative of production work.
